BNSF Railway

Crude by Rail Safety Overview

April 2015
Rail Transports Crude Safely

• Record crude volumes delivered safely - 99.997% of crude shipments shipped without incident

• 2012, 2013 and 2014 safest years on record, with rail volumes of all kinds increasing as economy recovers
BNSF’s Safety Overview

- Rail is safest mode of land transportation
- BNSF’s safety vision is to prevent incidents in the first place
- BNSF has a broad-based risk reduction program
BNSF vs. Industry Reportable Rail Equipment Incident Rate (Incidents per Million Train Miles)

Source: FRA – Data for 2014 through Oct. 31 2014
• BNSF is now the largest transporter of HAZMAT in North America
• 99.997% of rail industry shipments of hazardous materials reach their destination without a release caused by a train incident.
## Hazmat Release Analysis

*6000 gal release of flammable liquid and 1,000 pounds release of flue dust
BNSF will spend a record $6 billion on capital projects in 2015 to support maintenance and expansion. 2014 = $2.3 billion for network maintenance.
Prevention: Four Main Causes for Derailments

### Action Plans to Reduce Risk

#### Mechanical
- Robust Detector Network
- Technology Enhancements

#### Operations
- Training
- Remote monitoring / Self reporting protocol
- Positive Train Control

#### Engineering
- Inspections – Technology & Methods
- Strong capital plans
- Stronger Infrastructure

#### Miscellaneous
- Operating Practices/Alerts (weather-related)

### Reportable Rail Equipment Incidents

Prevention: Inspection/Condition Based on Safety Approach

- **Bridge and Track Inspections**
  - BNSF inspects tracks and bridges more often than required by FRA
    - Most key routes on BNSF are inspected 4 times per week and the busiest main lines are inspected daily
  - Track inspections include state-of-the-art technology to detect internal and external flaws in the rail and track structure
  - Weather and earthquake inspections

- **Proactive Rail Equipment Defect Detection**
  - Devices deployed across the network
    - Wheel Impact Load Detector
    - Warm Bearing Detection System
    - Hot / Cold Wheel Detector
    - Acoustic Bearing Detectors
Prevention: Operating Practices for Key Trains

- Longstanding BNSF/Rail Industry best practices for special handling hazardous materials ("Key Trains") now extend to crude and ethanol shipments

- Key Train Definition:
  - 1 or more loads of Toxic Inhalation/Poisonous Inhalation (TIH/PIH) materials
  - 20 or more tank loads of any hazardous materials

- Special Handling for Key Trains:
  - Special identification and tracking
  - Speed Restrictions: 50 mph max speed limit on Key Trains
  - Key Train Routes: wayside wheel bearing detector spacing, frequency of track inspections, minimum track maintenance standards for tracks used to meet or pass Key Trains
  - Key Trains will not be left unattended on main line or siding tracks, unless a detailed briefing regarding securement procedures has taken place between train crew members and the train dispatcher. Key Trains left unattended will have reverser removed and cab will be locked when equipped
Prevention: Positive Train Control Deployment Will Enhance Safety

Digital wireless communication technology

- Prevent train-to-train collisions
- Enforce speed limits
- Protect roadway workers and equipment
- Prevent movement of train through a switch left in improper position

Interoperability allows operating on other railroads

Predictive, advanced train control safety technology
Mitigation: “Next Generation Tank Car” NGTC

EVOLUTION OF RAIL INDUSTRY TANK CAR STANDARDS FOR CRUDE OIL

The railroad industry is proposing to increase the federal tank car design and construction standards for new tank cars used to transport crude oil. This proposal comes after a previous upgrade proposal which the industry voluntarily adopted and has been observing since October 2011. This graphic shows the additional tank car components included in the latest rail industry proposal.

**HIGH CAPACITY PRESSURE RELIEF VALVE**
- Current Standard: No requirement
- Latest Rail Industry Proposal: Requires a high capacity pressure relief device to protect against a rise in internal pressure resulting from fire. Provides for faster release of product.

**TOP FITTINGS PROTECTION**
- Current Standard: Requires top fittings protection to protect the integrity of valves and fittings used to load product in the event of an accident.
- Latest Rail Industry Proposal: Contains the same requirement.

**STEEL TANK**
- Current Standard: Requires a minimum ½ inch thick steel tank for unjacketed cars and a minimum ¾ inch thick steel tank for jacketed cars.
- Latest Rail Industry Proposal: Requires a minimum ¾ inch thick steel tank.

**HEAD SHIELDS**
- Current Standard: Requires minimum ½ inch thick half height head shields at both ends of the tank car to improve puncture resistance.
- Latest Rail Industry Proposal: Requires ½ inch thick full-height head shields at both ends of the tank car.

**BOTTOM OUTLET HANDLES**
- Current Standard: No requirement
- Latest Rail Industry Proposal: Requires bottom outlet handle reconfiguration to prevent the handle from inadvertently opening the bottom outlets in the event of an accident.

**JACKET AND THERMAL PROTECTION**
- Current Standard: Requires a minimum ½ inch thick steel jacket OR a ¾ inch thick steel jacket.
- Latest Rail Industry Proposal: Requires the addition of both a ½ inch thick steel jacket around the tank car and thermal protection.

Response: First Responder Coordination

- Shipment Information Access by First Responders
- Training First Responders, Employees and Customer Employees
- Mobilizing in the event of an incident
Response: First Responder Access to Information

BNSF already provides local first responders information about shipments upon request

However, by July 2014, per agreement with USDOT

- Railroads will develop a nationwide inventory of resources for “Key Route” emergency responders
- Locations for staging emergency response equipment
- Contacts for community notification
- Provide to U.S. DOT and available to appropriate emergency responders

As of June 7, 2014 Executive Order from US DOT also requires railroads to immediately notify State Emergency Response Commissions about the operation of trains carrying more than 1,000,000 gallons of Bakken crude oil through their states
Single Car Lookup

Equipment Id is a set of letters (up to 4) and numbers (up to 6) on the side of every freight car. See the example below outlined in red.

ID: GATX41667
LD/MTY: LOADED
HAZARDOUS
UN/NA ID: UN1203
PSN: GASOLINE
Hazard Class: 3
Railroad: CPRS
Railroad Phone: (800) 716-9132
GUIDE 128
FLAMMABLE LIQUIDS (Non-Polar / Water-Immiscible)
POTENTIAL HAZARDS
FIRE OR EXPLOSION

HIGHLY FLAMMABLE: Will be easily ignited by heat, sparks or flames.
Vapors may form explosive mixtures with air.
Vapors may travel to source of ignition and flash back.
Most vapors are heavier than air. They will spread along ground and collect in low or confined areas (sewers, basements, tanks).
Vapor explosion hazard indoors, outdoors or in sewers.
Response: BNSF/First Responder
Local Training

• BNSF and the railroad industry train first responders in their communities under a longstanding program called “TRANSCAER” (Transportation Community Awareness and Emergency Response)
  • Hands-on equipment in field – Instructor lead
  • Train list / shipping papers
  • Placards
  • Equipment
  • Incident Assessment

• BNSF trains an average of 4,000 local emergency responders each year in communities across network. Over 8,000 trained in 2014
Response: Training First Responders at Pueblo, CO National Facility

- Security and Emergency Response Training Center (SERTC) at Pueblo, Colorado national railroad research/training facility (TTCI)
- In-depth hazmat emergency response training to more than 30,000 emergency responders and railroad and chemical industry employees.
- $5 million industry commitment to train additional first responders on crude oil routes
- BNSF will sponsor (tuition and travel) emergency responders
  - 2014 = 714
  - 2015 = 500
Response: Incident Mobilization

BNSF pre-positions
212 first responders
and equipment at 60 locations
across the network.

• Industrial fire-fighting foam trailers
• Emergency breathing air trailers
• Chlorine kits
• Midland kits
• Air monitoring assets
BNSF HAZMAT Responder Locations

242 Responders at 60 Locations
AR-AFFF Fire Trailer Program

1. Designed to address the surge in Ethanol and Crude Oil shipments.

2. Provide equipment, supplies and contract Firefighters in response to polar solvent and fire incidents

- Currently 20 trailers throughout system location based on HM. 3 under construction
BNSF Fire Trailers

Fire Trailer
- Type I (Large)
- Type II (Small)

• Tactical Toxicology (Tac-Tox)
• INet
• CRA
Remediation

BNSF will restore the site

- BNSF is responsible for mitigation of the spill and any restoration tasks
- BNSF contracts with pre-approved consultants and contractors to perform the remediation and restoration
- State agencies oversee the work and BNSF must obtain their concurrence before a site is acceptably closed

Cameron, Texas, post derailment
